

PROVIDING RESILIENT ELECTRICITY

Red Mountain Electrical Reliability & Broadband Improvement Project:

Originally constructed in 1928, the Red Mountain line has been repaired and upgraded, but has reached its functional end-of-life. A new line, engineered with current technologies and design practices will be safer and more practical to maintain.

Reliability Projects:

Allow one substation to pick up the load of another in case of an outage.

- Telluride / Mountain Village
- Nucla-to-Norwood

Protection Hardware: Multiple options and routes to keep people and goods moving.

Local Microgrids: Electrical “islands” to maintain light, warmth and critical loads while repairs are made to main feed lines.
